

**HORTAU**

## Automation puts the crop in the driver's seat

**Improving crop health and increasing production is perhaps the biggest goal of irrigation management.**

Hortau's precision irrigation management system allows growers to monitor crop stress in real time to help them anticipate and reduce crop stress using soil tension and weather readings.

With Hortau's equipment in hand —along with the industry's best service and support — growers have realized improvement in crop health, while also recovering costs associated with water and energy by learning to irrigated precisely when the plants need it.

But growers can take it a step further with Hortau's automation by initiating irrigation instantly from their mobile device or computer (remote start).

Better yet, automation allows the plants take the guesswork out of watering by using pre-set sensor readings such as soil tension levels or temperatures to trigger an irrigation event, saving you time and labor.

Find out how Hortau automation specialists can work with you directly to create an automation framework that is custom tailored to your operation.

### **Hortau Automation Benefits:**

- ➔ Auto start on an assortment of electric and diesel engines
- ➔ Valve actuation on up to eight DC latching solenoids
- ➔ Device configuration over the air
- ➔ Initiate irrigation based on sensor readings
- ➔ Ability to manually override automation in Irrolis Dashboard
